

DEGs分析pipeline: FeatureCounts + DESeq2 + 过滤数据 + 去overlapping

作者：李凯旋，卢建璋，徐舟通（以上名字按姓氏拼音字母排序）

一、什么是DEGs分析？为什么要进行DEGs分析？

1. DEGs analysis，即 Differential Expression Genes，意为差异化基因表达分析。差异化基因表达分析有助于我们了解不同样本的基因表达差异，进而了解不同组织或者不同细胞的状态与功能差异。
2. 本文将使用非小细胞肺癌细胞系 A549 与人类正常肺组织样本对比为例，展示DEGs分析的具体流程。

二、FeatureCounts

· reference: “featureCounts: an efficient general purpose program for assigning sequence reads to genomic features”

1. 在RNA-seq分析得到比对文件 .bam (确保已经过排序和去重)后，我们使用featureCounts软件来统计样本文件中有多少reads匹配到了我们所感兴趣(features)的区域，比如exon区域
2. 代码

Bash

```
1 # 环境准备
2 source ~/.bashrc
3 conda activate twobittofa
4
5 # featureCounts格式: featureCounts [options] <input.file>
6 # 实例:
7 featureCounts \
8 -T 8
9 -p \
10 -t exon \
11 -g exon_id \
12 -a /public/workspace/jianl/Reference/Human/annotation/genecode.v19.annotation.gtf \
13 -o featurecounts_result_exonid_A549.txt \
14 # inputfile 有几个写几个, 均为 .bam 文件, △注意: 文件输入顺序务必为先normal后cancer
    的顺序, 以免影响后续Log2FoldChange的计算
15 ENCFF155XBJ_dedu.sort.bam \
16 ENCFF150VSG_dedu.sort.bam \
17 ENCLB555AUL_dedu.sort.bam \
18 ENCLB555AUK_dedu.sort.bam
19
```

3. 参数解释:

1. input file: Input bam/Sam files, supporting multiple file inputs(spreated by /)
 2. -a < string >: Refer to GTF file name, support Gzipped file format **GTF_path:**
/public/workspace/jianl/Reference/Human/annotation/genecode.v19.annotation.gtf
 3. -o < string >: The name of the output file that contains the number of read statistics
 4. -T: The value ranges from 1 to 32
 5. -p: Used only in paired-end cases, the fragment is counted but the read is not
 6. -f: If -f is set, feature level data such as exon-level will be counted, otherwise meta-feature level data such as gene-levels will be counted. **Through the comparison of -f parameters in this DEG analysis, it is found that the parameter most consistent with expectations is “exonid”**
- 为了避免占用运行内存过大导致进程被kill的情况, 也可以使用bsub将程序交给服务器后台运行

Bash

```
1
2 #!/bin/sh
3 #PBS -l nodes=1:ppn=16
4 #PBS -l walltime=24:00:00
5 #PBS -N featurecounts_A549
6 #PBS -d /public/workspace/jianl/User/Zhoutong-Xu/zhoutong/A549_DEG/
7 #PBS -o featurecounts.out
8 #PBS -e featurecounts.err
9 source ~/.bashrc
10 conda activate twobittofa
11 featureCounts -T 8 -p -t exon -g exon_id -a /public/workspace/jianl/Reference/
   Human/annotation/genencode.v19.annotation.gtf \
12 -o featurecounts_result_exonid_A549.txt \
13 ENCFF155XBJ_dedu.sort.bam \
14 ENCFF150VSG_dedu.sort.bam \
15 ENCLB555AUL_dedu.sort.bam \
16 ENCLB555AUK_dedu.sort.bam
```

三、DESeq2

1. 文件准备：

上一步得到 featurecounts_result_exonid_A549.txt，查看文件会发现某些基因在一条染色体上的多个位置表达，或者在多条染色体上的不同位置表达（例如DNA表达控制基因Y_RNA）（图1）。由于这些基因有着实际的生物学意义，而我们最后需要的bed文件格式要求每一行只能有一个chr序号，一个chr开始位置，一个chr结束位置，所以我们需要把这些行分成多行。

| | | | | | | | | | |
|-------------------|----------------|-------------------|-------------------|-------|-----|---|---|---|---|
| ENSE00001718035.1 | chr1;chr1 | 29321;29321 | 29370;29370 | -;- | 50 | 0 | 0 | 0 | 0 |
| ENSE00003624050.1 | chr1 24738 | 24891 - | 154 0 | 0 0 | 0 | 0 | 0 | 0 | 0 |
| ENSE00001642865.1 | chr1 18268 | 18379 - | 112 0 | 0 0 | 0 | 0 | 0 | 0 | 0 |
| ENSE00003638984.1 | chr1;chr1;chr1 | 17915;17915;17915 | 18061;18061;18061 | -;-;- | 147 | 0 | 0 | 0 | 0 |
| ENSE00001699689.1 | chr1;chr1 | 17602;17602 | 17742;17742 | -;- | 141 | 0 | 0 | 0 | 0 |
| ENSE00001656010.1 | chr1;chr1;chr1 | 17233;17233;17233 | 17364;17364;17364 | -;-;- | 132 | 0 | 0 | 0 | 0 |
| ENSE00001760358.1 | chr1;chr1 | 16854;16854 | 17055;17055 | -;- | 202 | 0 | 0 | 0 | 0 |

| ENSE00001375216.1 | chr1;chr1 | 15904;15904 | 15947;15947 | -;- | 44 | 0 | 0 | 0 | 0 |
| ENSE00001388009.1 | chr1;chr1 | 15796;15796 | 15901;15901 | -;- | 106 | 0 | 0 | 0 | 0 |

图1: featurecounts_result_exonid_A549.txt截图

使用 format.py脚本对文件进行处理，代码如下：

Python

```
1  infile = open('input_file_name.txt')
2  outfile = open('output_file_name.txt', 'w')
3  outfile.write(infile.readline())
4  for lines in infile:
5      line = lines.split('\t')
6      chrs = line[1].split(';')
7      samples = '\t'.join(line[5:])
8      if(len(chrs) < 1):
9          print(line)
10     elif(len(chrs) > 1):
11         starts = line[2].split(';')
12         ends = line[3].split(';')
13         strand = line[4].split(';')
14         out = []
15         for i in range(0, len(starts)):
16             out.append(starts[i] + '\t' + ends[i] + '\t' + strand[i])
17         out = list(set(out))
18         if(len(out) != 1):
19             print(line[0])
20         for j in range(0, len(out)):
21             outfile.write(line[0] + '\t' + chrs[j] + '\t' + out[j] + '\t' + sam
ples)
22     else:
23         outfile.write(lines)
```

运行方法:将

"/public/workspace/jianl/Software/DEGtools/format.py"拷贝到自己的文件夹下，并修改输入文件名和输出文件名

```
infile = open('featurecounts_result_exonid_A549.txt')
outfile = open('featurecounts_result_exonid_A549_out.txt', 'w')
```

保存后运行:

Bash

```
1  conda activate tests
2  python3 format.py
```

得到符合要求的文件:

| Geneid | Chr | Start | End | Strand | Length | ENCFF155XBJ_dedu.sort.bam | ENCFF150VSG_dedu.sort.bam | ENCLB555AUL_dedu.sort.bam | ENCLB555AUK_dedu.sort.bam |

下载文件至本地

2. DESeq2 with R

- Reference: "*Moderated estimation of fold change and dispersion for RNA-seq data with DESeq2*"

代码如下：

a. 读入数据：

R

```

1 #载入DEseq2包
2 library(DESeq2)
3 #读入数据，按"\t"取数据  ⚠注意修改你自己的文件路径
4 data <- read.table("/Users/apple/LAB/A549_vs_Normal/featurecounts_result_exoni
  d_A549_out.txt",header=TRUE,sep = "\t")

```

b. 数据整合与准备：

R

```
1 #修改samplename
2 sampleNames <- c("ENCF155XBJ","ENCF150VSG","ENCLB555AUL","ENCLB555AUK")
3 names(data)[7:10] <- sampleNames
4 #提取数据构建表达矩阵
5 countData <- as.matrix(data[7:10])
6 #整合chr信息，防止丢失
7 data_1 <- unite(data, "idchr", c("Geneid","Chr","Start","End"), sep = "#", remove = TRUE)
8 rownames(countData) <- data_1$idchr
9 #设置分组信息：确保样本与分组信息一一对应，比如"ENCF155XBJ","ENCF150VSG"对应于normal组，"ENCLB555AUL","ENCLB555AUK"对应于癌症组
10 database <- data.frame(name=sampleNames, condition=c("Normal","Normal","Tumor","Tumor"))
11 rownames(database) <- sampleNames
```

c. 从表达矩阵countData和样品信息colData构建DESeqDataSet对象

R

```
1 dds <- DESeqDataSetFromMatrix(countData, colData=database, design= ~ condition)
2 dds <- dds[ rowSums(counts(dds)) > 1, ] #过滤低丰度数据
```

d. 差异化表达基因分析

R

```
1 #差异化表达分析
2 dds <- DESeq(dds)
3 #生成res对象
4 res <- results(dds)
5 #查看结果，确保分组正确
6 head(res)
```

```
> head(res)
log2 fold change (MLE): condition Tumor vs Normal
Wald test p-value: condition Tumor vs Normal
DataFrame with 6 rows and 6 columns
```

e. 按照q-value的值进行分组

- Null (g0) : q-value >0.05

R

```
1 write.csv(res, "/Users/apple/LAB/A549_vs_Normal/unfilter.csv")
2 unfilter <- read.csv("/Users/apple/LAB/A549_vs_Normal/unfilter.csv")
3 unfilter <- separate(data = unfilter, "X", into = c("Geneid", "Chr", "Start", "End"), sep = "#")
4 unfilter <- subset(unfilter, abs(log2FoldChange) > 0.585)
5
6 unfilter$Start <- as.numeric(unfilter$Start)
7 unfilter$End <- as.numeric(unfilter$End)
8 g0_null_up <- arrange(unfilter[which(unfilter$padj > 0.05 & unfilter$log2FoldChange > 0.585),], Chr, Start, End)
9 g0_up <- g0_null_up[, -c(1, 5, 7, 8, 9, 10)]
10 g0_null_down <- arrange(unfilter[which(unfilter$padj > 0.05 & unfilter$log2FoldChange < -0.585),], Chr, Start, End)
11 g0_down <- g0_null_down[, -c(1, 5, 7, 8, 9, 10)]
```

- Significant(g1-g5): q-value <0.05

R

```
1 filter_res <- subset(res, padj < 0.05 & abs(log2FoldChange) > 0.585 )
2 write.csv(filter_res, "/Users/apple/LAB/A549_vs_Normal/filter.csv")
3 aa <- read.csv("/Users/apple/LAB/A549_vs_Normal/filter.csv")
4 #还原chr, start, end信息
5 DEGs_DESeq2 <- separate(data = aa, "X", into = c("Geneid", "Chr", "Start", "End"), sep = "#")
6
7 #开始分组
8 n1 = 5e-2
9 n2 = 1e-2
10 n3 = 5e-3
11 n4 = 1e-3
12 n5 = 5e-4

  E, quote = FALSE)
13 write.table(g5_up, file = "g5_up.txt", row.names = FALSE, col.names = FALSE, q
  uote = FALSE)
14 write.table(g5_down, file = "g5_down.txt", row.names = FALSE, col.names = FALS
  E, quote = FALSE)
```

f. 去重叠区域

- 标准的bedgraph格式文件如下：

| | | | |
|------|--------|--------|-------------|
| chr1 | 168100 | 168165 | 3.482060032 |
| chr1 | 169049 | 169264 | 3.249119995 |
| chr1 | 234355 | 234484 | 4.310988702 |
| chr1 | 236112 | 237955 | 2.904278888 |
| chr1 | 564442 | 564813 | 0.872117909 |
| chr1 | 682075 | 685396 | 1.17801642 |
| chr1 | 704877 | 705092 | 3.324057219 |
| chr1 | 764383 | 764484 | 3.608336095 |

- 使用 de_overlap.py(路径： /public/workspace/jianl/Software/DEGtools/de_overlap.py)将文件中的重叠片段分为若干个文件

Python

```
1  """
2  made by Fang Anxuan & Shiyang Song & Zhoutong Xu
3  """
4  with open("g5_down.txt") as f:
5      all_geneData = f.readlines()
6      '''
7      print(all_geneData[0])
8      '''
9      res_list = [""]
10     previous_groupIndex = 1
11
12     previous_geneData = all_geneData[0]
13
14     res_list[0] += previous_geneData
15     p_end = previous_geneData.split(" ")[2]
16     p_chr = previous_geneData.split(" ")[0]
17
18     for geneData in all_geneData[1:]:
19         chr = geneData.split(" ")[0]
20         start = geneData.split(" ")[1]
21         end = geneData.split(' ')[2]
22         if p_chr == chr:
23             if int(start) <= int(p_end):
24                 if(previous_groupIndex >= len(res_list)):
25                     res_list.append('')
26                     res_list[previous_groupIndex] += geneData
27                     previous_groupIndex += 1
28                     p_end = max(p_end, end)
29             else:
30                 res_list[0] += geneData
31                 previous_groupIndex = 1
32                 p_end = geneData.split(" ")[2]
33         else:
34             res_list[0] += geneData
35             previous_groupIndex = 1
36             p_end = geneData.split(" ")[2]
37             p_chr = geneData.split(" ")[0]
38
39     index = 0
40     for res in res_list:
41         name = "g5_down_%d.bedgraph"
42         with open(name%index,"w") as f:
43             f.write(res)
44             index += 1
```

■ 生成的文件如下（部分）：

| | | | |
|--------------------|---------|--------|----|
| g0_down_2.bedgraph | 上午 1:42 | 100 B | 文件 |
| g0_down_1.bedgraph | 上午 1:42 | 8 KB | 文件 |
| g0_down_0.bedgraph | 上午 1:42 | 1.0 MB | 文件 |
| g0_up_3.bedgraph | 上午 1:42 | 67 B | 文件 |
| g0_up_2.bedgraph | 上午 1:42 | 526 B | 文件 |
| g0_up_1.bedgraph | 上午 1:42 | 11 KB | 文件 |
| g0_up_0.bedgraph | 上午 1:42 | 804 KB | 文件 |

四、Bedgraph 转 bw 文件（server）

- **background:** bw文件是最后能在网页上被可视化的文件格式，本部分将着重介绍如何批量将多个bedgraph文件转成bw文件

1. 将上一步生成的所有bedgraph格式文件上传至服务器中的“t”文件夹下（自己新建的文件夹）

| < > ↻ jianl_LAB ▶ workspace ▶ jianl ▶ User ▶ Zhoutong-Xu ▶ zhoutong ▶ A549_DEG ▶ | | | | ⋮ |
|--|-----------|----------|----------|-----------|
| 名称 | 修改日期 | 大小 | 种类 | |
| ENCFF150VSG_dedu.sort.bam | 2022/3/21 | 1.07 GB | 文件 | |

| featurecounts_result_exonid_A549.txt.summary | 2022/3/21 | 652 B | 文件 | |
| featurecounts.sh | 2022/3/21 | 525 B | Shell脚本 | |
| format.py | 2022/3/21 | 830 B | Python脚本 | |
| > t | 上午 2:11 | -- | 文件夹 | format.py |

| | | | |
|--------------------|---------|--------|----|
| g0_down_0.bedgraph | 上午 2:11 | 1.0 MB | 文件 |
| g0_down_1.bedgraph | 上午 2:11 | 8 KB | 文件 |
| g0_down_2.bedgraph | 上午 2:11 | 100 B | 文件 |
| g0_up_0.bedgraph | 上午 2:11 | 804 KB | 文件 |
| g0_up_1.bedgraph | 上午 2:11 | 11 KB | 文件 |
| g0_up_2.bedgraph | 上午 2:11 | 526 B | 文件 |
| g0_up_3.bedgraph | 上午 2:11 | 67 B | 文件 |
| g1_down_0.bedgraph | 上午 2:11 | 232 KB | 文件 |
| g1_down_1.bedgraph | 上午 2:11 | 293 B | 文件 |
| g1_up_0.bedgraph | 上午 2:11 | 207 KB | 文件 |
| g1_up_1.bedgraph | 上午 2:11 | 963 B | 文件 |
| g1_up_2.bedgraph | 上午 2:11 | 72 B | 文件 |
| g2_down_0.bedgraph | 上午 2:11 | 65 KB | 文件 |

2.

将/public/workspace/jianl/Software/DEGtools/generate_bedtobw.py 文件下载到“t”文件夹的上层目录中，修改相关的输入输出内容，运行此程序。代码及注意事项如下：

Python

```
1  '''
2  generate bedtobw commands
3  '''
4  import os
5  path = '/root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/t'
6  os.chdir(path)
7
8  filenames = os.listdir(path)
9
10 outfile = open('/root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bedtob
    w.txt', 'w')
11
12 for i in range(0, len(filenames)):
13     outfile.write('/root/bin/x86_64/bedGraphToBigWig ./t/' +
14                  filenames[i-1] +
15                  ' /root/D/home/data/mysql/test/zhoutong/DEG/Reference/h
    g19.chrom.sizes ./bw/' +
16                  filenames[i-1] +
17                  '.bw\n\n')
```

- 获得的bedtobw.txt文件如下：

```
/root/bin/x86_64/bedGraphToBigWig ./t/g0_down_2.bedgraph /root/D/home/data/mysql/test/zhoutong/DEG/Reference/hg19.chrom.sizes ./bw/g0_down_2.bedgraph.bw
/root/bin/x86_64/bedGraphToBigWig ./t/g1_up_2.bedgraph /root/D/home/data/mysql/test/zhoutong/DEG/Reference/hg19.chrom.sizes ./bw/g1_up_2.bedgraph.bw
/root/bin/x86_64/bedGraphToBigWig ./t/g0_up_1.bedgraph /root/D/home/data/mysql/test/zhoutong/DEG/Reference/hg19.chrom.sizes ./bw/g0_up_1.bedgraph.bw
/root/bin/x86_64/bedGraphToBigWig ./t/g4_down_0.bedgraph /root/D/home/data/mysql/test/zhoutong/DEG/Reference/hg19.chrom.sizes ./bw/g4_down_0.bedgraph.bw
/root/bin/x86_64/bedGraphToBigWig ./t/g0_up_2.bedgraph /root/D/home/data/mysql/test/zhoutong/DEG/Reference/hg19.chrom.sizes ./bw/g0_up_2.bedgraph.bw
/root/bin/x86_64/bedGraphToBigWig ./t/g0_up_3.bedgraph /root/D/home/data/mysql/test/zhoutong/DEG/Reference/hg19.chrom.sizes ./bw/g0_up_3.bedgraph.bw
/root/bin/x86_64/bedGraphToBigWig ./t/g0_up_0.bedgraph /root/D/home/data/mysql/test/zhoutong/DEG/Reference/hg19.chrom.sizes ./bw/g0_up_0.bedgraph.bw
/root/bin/x86_64/bedGraphToBigWig ./t/g5_up_3.bedgraph /root/D/home/data/mysql/test/zhoutong/DEG/Reference/hg19.chrom.sizes ./bw/g5_up_3.bedgraph.bw
/root/bin/x86_64/bedGraphToBigWig ./t/g4_up_1.bedgraph /root/D/home/data/mysql/test/zhoutong/DEG/Reference/hg19.chrom.sizes ./bw/g4_up_1.bedgraph.bw
/root/bin/x86_64/bedGraphToBigWig ./t/g0_down_0.bedgraph /root/D/home/data/mysql/test/zhoutong/DEG/Reference/hg19.chrom.sizes ./bw/g0_down_0.bedgraph.bw
```

- 运行之：bash bedtobw.txt。即可得所有的bw文件。

五、添加track以及修改 trackDb.ra 文件

1. 在网站后台服务器的/root/D/home/data/mysql/test/ 下创建自己的文件夹，用于存放bw数据。
2. 文件夹外，新建a.py程序，代码如下

Python

```
1 import os
2 import re
3
4 path = '/root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/'
5 os.chdir(path)
6 filenames = os.listdir(path)
7
8
9 outfile = open('/root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/newtrack.txt','w')
10
11
12 file_title = []
13 file_regulate_info = []
14 for i in range(0,len(filenames)):
15     file_title += re.findall(r'(\w+).bed',filenames[i])
16     file_regulate_info += re.findall(r'_(\w+)_',filenames[i])
17
18 for i in range(0,len(filenames)):
19     outfile.write('/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_' + file_regulate_info[i] + '_' + file_title[i] + ' /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/' + filenames[i] + '\n')
```

生成添加track的代码集合：

```
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_up_g5_up_1 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g5_up_1.bedgraph.bw
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_up_g0_up_1 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g0_up_1.bedgraph.bw
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_down_g4_down_0 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g4_down_0.bedgraph.bw
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_down_g5_down_1 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g5_down_1.bedgraph.bw
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_down_g0_down_2 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g0_down_2.bedgraph.bw
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_up_g5_up_3 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g5_up_3.bedgraph.bw
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_down_g1_down_1 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g1_down_1.bedgraph.bw
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_down_g2_down_0 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g2_down_0.bedgraph.bw
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_up_g5_up_2 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g5_up_2.bedgraph.bw
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_up_g2_up_2 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g2_up_2.bedgraph.bw
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_up_g2_up_1 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g2_up_1.bedgraph.bw
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_up_g4_up_0 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g4_up_0.bedgraph.bw
/root/bin/x86_64/hgBbIDbLink hg19 unfil_A549_down_g0_down_1 /root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/bw/g0_down_1.bedgraph.bw
```

运行之： bash newtrack_up.txt

3. 生成trackDb.ra的添加内容

- 运行b.py

Python

```
1 import re
2 outfile = open('/root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/trackdb.txt','w')
3 inputfile = open('/root/D/home/data/mysql/test/zhoutong/DEG/A549-unfilter/newtrack.txt')
```

```

4 color_up = {'g0':'167,167,167', 'g1':'246,183,198', 'g2':'244,106,139', 'g3':
  '245,8,65', 'g4':'161,4,42', 'g5':'95,3,25'}
5 color_down = {'g0':'167,167,167', 'g1':'191,203,249', 'g2':'109,139,248', 'g3'
  : '6,57,249', 'g4':'4,37,161', 'g5':'2,21,91'}
6 qvalue = {'g0':'adjusted p-value > 0.05', 'g1':'0.05 > adjusted p-value > 0.0
  1', 'g2':'0.01 > adjusted p-value > 0.005', 'g3':'0.005 > adjusted p-value >
  0.001', 'g4':'0.001 > adjusted p-value > 0.0005', 'g5':'adjusted p-value < 0.00
  05'}
7
8 line0 = []
9 line_all = []
10 track_name = []
11 for line in inputfile:
12     line0 = line.strip('\n')
13     line_all = line0.split(' ')
14     track_name.append(line_all[2])
15     line_all = []
16
17 qvalue_key = ''
18 file_regulate = ''
19 '''
20 qvalue_key = re.findall(r'g\d', track_name[2])
21
22 if re.findall(r'up', track_name[0]) == 'up' :
23     file_regulate = 'up'
24 else :
25     file_regulate = 'down'
26
27 print(qvalue_key[0])
28 print(file_regulate)
29 print(re.findall(r'up', track_name[0])[0])
30 '''
31
32 for i in range(0, len(track_name)):
33     qvalue_key = re.findall(r'g\d', track_name[i])
34     if re.findall(r'up', track_name[i]) == [] :
35         file_regulate = 'down'
36     elif re.findall(r'up', track_name[i])[0] == 'up' :
37         file_regulate = 'up'
38     if file_regulate == 'up' :
39         outfile.write('track ' + track_name[i] + '\n' + 'shortLabel ' + track_
name[i] + '\nlonglabel ' + qvalue[qvalue_key[0]] + ', up regulated\n' + 'type
  bigWig\n' + 'parent DEGs_A549_vs_normal_RNA\n' + 'color ' + color_up[qvalue_k
ey[0]] + '\n\n')
40     else :
41         outfile.write('track ' + track_name[i] + '\n' + 'shortLabel ' + track_
name[i] + '\nlonglabel ' + qvalue[qvalue_key[0]] + ', down regulated\n' + 'typ
e bigWig\n' + 'parent DEGs_A549_vs_normal_RNA\n' + 'color ' + color_down[qvalu

```

```

    e_key[0]] + '\n\n')
42     qvalue_key = ''
43     file_regulate = ''
44

```

- 生成的文件如下：

```

1 track unfil_A549_up_g5_up_1
2 shortLabel unfil_A549_up_g5_up_1
3 longlabel adjusted p-value < 0.0005, up regulated
4 type bigWig
5 parent DEGs_A549_vs_normal_RNA
6 color 95,3,25
7
8 track unfil_A549_up_g0_up_1
9 shortLabel unfil_A549_up_g0_up_1
10 longlabel adjusted p-value > 0.05, up regulated
11 type bigWig
12 parent DEGs_A549_vs_normal_RNA
13 color 167,167,167
14
15 track unfil_A549_down_g4_down_0
16 shortLabel unfil_A549_down_g4_down_0
17 longlabel 0.001 > adjusted p-value > 0.0005, down regulated
18 type bigWig
19 parent DEGs_A549_vs_normal_RNA
20 color 4,37,161
--

```

- 将文件中的内容复制到trackDb.ra文件中，在server中运行 /root/bin/x86_64/hgTrackDb human hg19 trackDb_NEW /root/D/home/kent/src/hg/lib/trackDb.sql /root/D/home/data/mysql/ 即可更新服务器，完成数据的上传！

六、祝代码顺利，身体健康，少熬夜哦～
